Day-05 Notes

Friday, 31 October 2025 7:59 AM

Recap of Content Rendering

------Session - 08 Inheritance----------
In AEM there are 3 types of inheritance

1. Resource Type hierarchy
2. Container Type hierarchy
3. Include hierarchy

----------RESOURCE TYPE INHERITANCE HIERARCHY----------
We achieve resource type inheritance with the property called -:
sling:resourceSuperType

This is the second most important property of AEM

In AEM whenever we need to inherit some OOTB features we inherit it from following two locations

1. **Foundation components**-> inside /libs
2. **Core components** -> It is a project created by developer community across the glob and maintained by Adobe. In AEM this project is located under /apps

NOTE -: In AEM as a cloudService Core component are not listed under/apps but they will be listed under/libs that is one of the difference between AEM 6.5 versus AEM as a cloud Service.

Whenever we give path for a component either to become a sling:resourceType or sling:resourceSuperType we should always use relative paths

---
----Session -07 HTL or SIGHTLY-------

HTL syntax

1. HTL Block Statement
2. HTL Expressions

Block statement

data-sly-use
data-sly-repeat
data-sly-list
data-sly-unwrap
daya-sly-include

----------Enumerable object or OOTB object----------

Write Class -> To use this class we create it's object -> To create object of the class we use new operator.

```
Class fruits {
        Private String shape;
        Private String color;
        Private String taste;
}

Class Food {
        Fruits mango = new Fruit();
        Mango.shape = "round";
        Mango.color = "yellow";
        Mango.taste= "sweet";

}
```
