Session - 17 - OSGi Services & Components

OSGIs Service
For a class to become a OSGi Service it has to fulfill below 3 conditions

1. It should have @Component annotation on top of the class
2. It should have a service attribute inside @Component annotation
3. It should implement an interface

OSGi Component
For a class to become an OSGi Component it has to fulfill below condition

1. It should have @Component annotation on top of the class.

What is Interface

Implementing an interface

Abstract classes

Design principle -: Programming towards interface

You have noticed few things

1. To create an object of service we will use its interface rather than implrementation class.
2. To inject Service into Sling Model you use @Inject annotation.
3. To inject a Service into another service we use @Reference annotation.

What will we use to inject a service into another service?

Homework

1. Create StringManipulationService which will have a stringAppend method which will have two string as input ant then it will append these two string with a suffix or prefix into it and give the final string as output.
   Example -> firststring -> Saurabh, second string -> Tripathi
   Output -> Saurabh Tripathi is the Best trainer in the world.

   To use this service you will call it inside your Employee component where you are getting two strings as input.

2. Now Create another Service name is DetailsService and in this service call your StringManipulation service which will give you string output which you use in your service to do something else.
   a. Note -: To call a service inside another service you need to use @Reference annotation.
