Configuring an XDM Schema

28 July 2026 11:48

Create an XDM schema

1. Open the Data Collection interface
2. Ensure you are in the correct sandbox. Locate the sandbox in the upper right corner
3. Go to **Schemas** in the left navigation
4. Select the **Create Schema** button on the top right
5. 

6. Select **Experience Event** in the following screen
7. Select **Next**

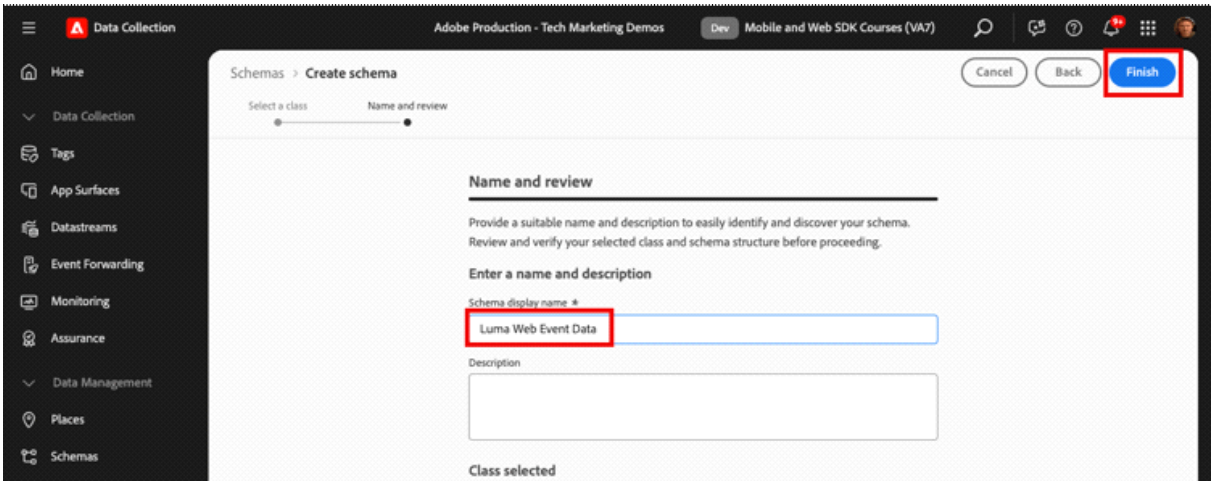

8. Enter the name for your schema under **Schema display name** field, in this case Luma

Web Event Data

TIP

A common naming convention for XDM schemas is to name the schema after the source of the data.

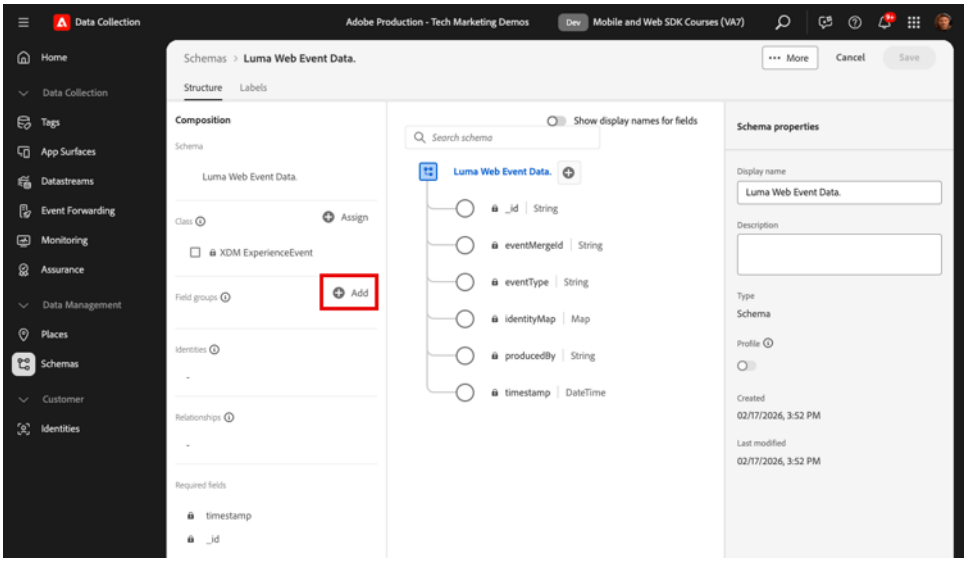

9.Select Finish

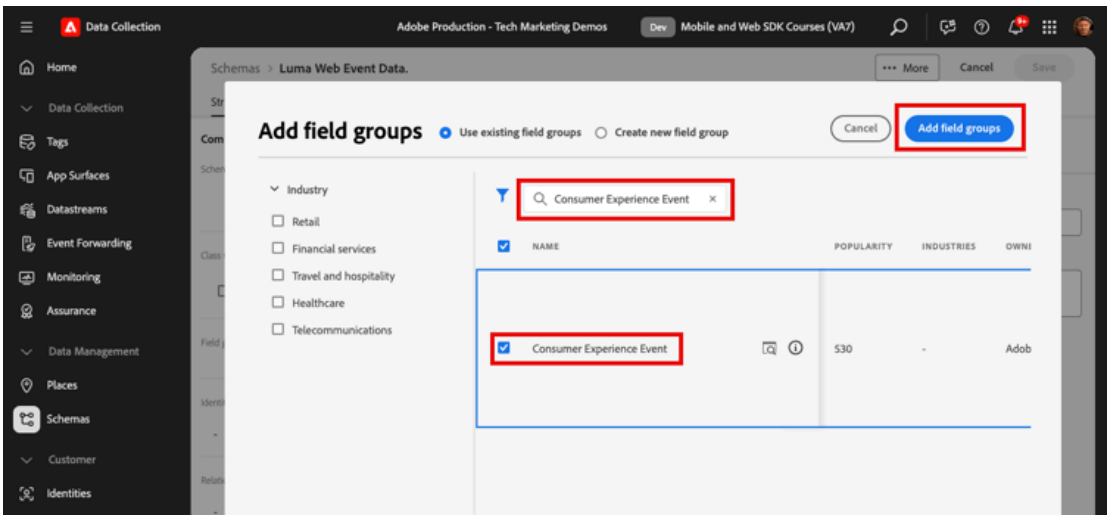

Add field groups

From <https://experienceleague.adobe.com/en/docs/platform-learn/implement-web-sdk/initial-configuration/configure-schemas>

1.In the **Field groups** section, select **Add**

1. Search for AEP Web SDK ExperienceEvent
2. Check the box
3. Search for Consumer Experience Event
4. Check the box
5. Select **Add field groups**

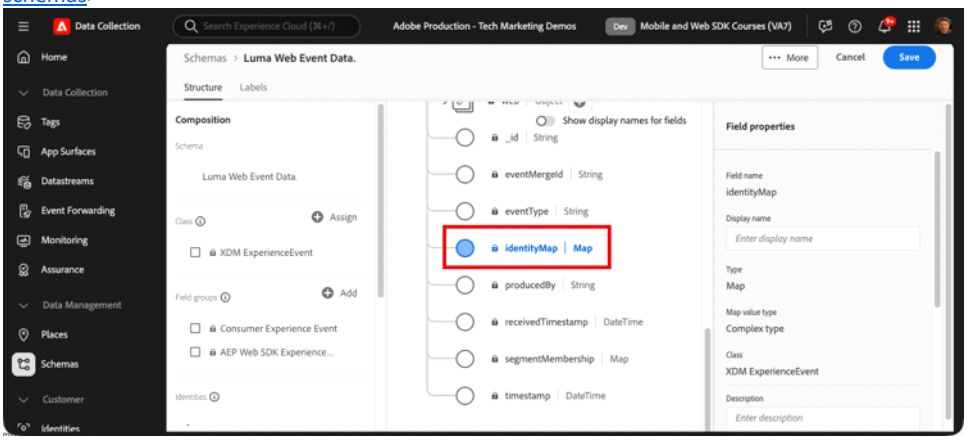

With both field groups, notice that you have access to the most commonly used key-value pairs required for data collection on the web

From <https://experienceleague.adobe.com/en/docs/platform-learn/implement-web-sdk/initial-configuration/configure-schemas>

The identityMap object

There is a special field used to identify web users called identityMap.

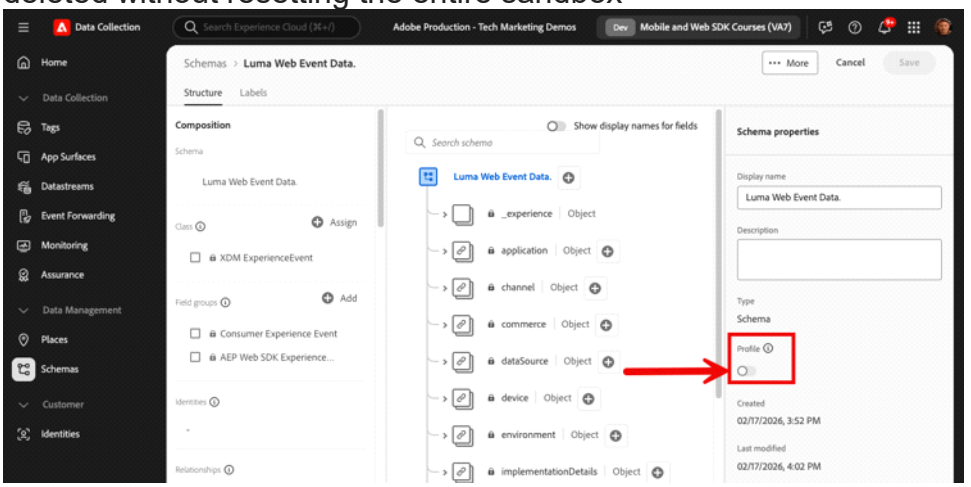

From <https://experienceleague.adobe.com/en/docs/platform-learn/implement-web-sdk/initial-configuration/configure-schemas>

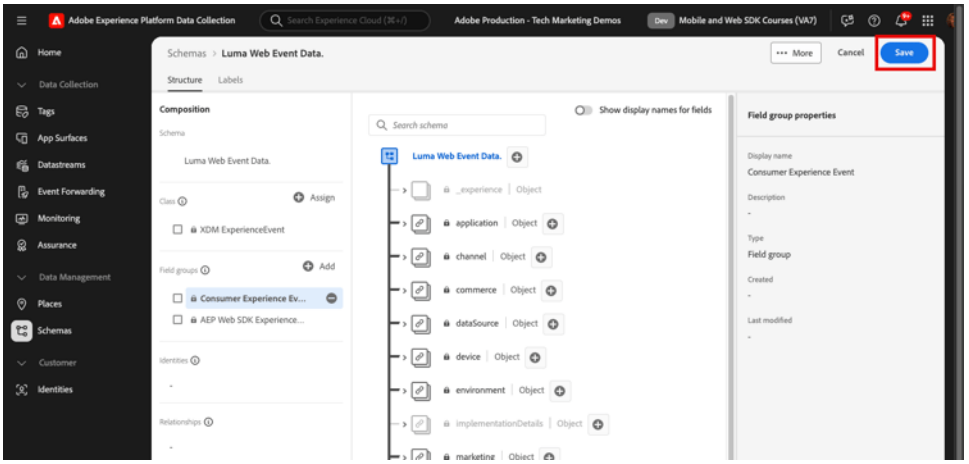

It is a must-have object for any web-related data collection, as it houses the Experience Cloud ID required for identifying users on the web. It is also the key to setting internal customer IDs for authenticated users. identityMap

IMPORTANT

It is possible to enable a schema for **Profile** now, but **do not** enable it at this point. Once a schema is enabled for Profile and data is ingested, it cannot be disabled or deleted without resetting the entire sandbox

To complete this lesson, select **Save** on the top right.

Now, you are able to reference this schema when you add the Web SDK extension to your tag property.
